

Photovoltaic fuses

gPV curve

from 1 to 600 A, up to 1500 VDC

Fuse protection

new

Function

SOCOME **gPV fuses** protect the installation against the inverse over-currents which could occur in photovoltaic installations.

Advantages

Breaking capacity up to 1500 VDC

High breaking capacity at 1500 VDC.

Product dedicated to PV installations

Operating ranges adjusted for small over-currents specific to PV installations.

High reliability

- Absolute protection over time guaranteed by the simplicity of manufacture and function (Joule effect).
- No downgrading of fuse characteristics over time.

Improved safety

The energy released whilst eliminating the fault (fuse blowing) is contained within the cartridge (no degassing).

What you need to know

Used characteristics

- I_{SC} : short circuit current of the string
- $I_{SC\ MAX}$: short circuit current of the string related to maximum sunlight density
- I_{RM} : maximum admitted reverse current
- I_n : fuse rating or fuse rated current (at 25°C in a RM disconnect switch)
- N_c : number of strings connected in parallel
- U_e : maximum fuse rated voltage
- $U_{OC\ MAX}$: maximum open circuit voltage in the lowest temperature conditions.

When to protect

A PV string requires an over-current protection when its own maximum admissible reverse current characteristic (I_{RM}) is less than the current generated by the rest of the installation (current generated by the "Nc-1" other strings).

How to protect

The overload protection is to be applied at each of the two polarities, regardless of whether the DC installation is earthed or not.

The solution for

- Photovoltaic protection

Strong points

- Breaking capacity up to 1500 VDC
- Product dedicated to PV installations
- High reliability
- Improved safety

Large range

- Additional range of disconnect switches and fuse bases - dedicated connection accessories.

Conformity to standards

- IEC 60269-6
- IEC 60269-1
- IEC 60269-2

How to choose the fuse protection

Voltage

$$U_o > U_{OC\ MAX}$$

In the absence of complementary information use $U_{OC\ MAX} = 1,2 U_{OC}$.

Fuse rating determination

Determination of the fuse rated current consists of choosing a protection capable of:

- Supporting without fusing the normal overload current during the periods of maximum sunlight density at the ambient temperature of the enclosure in which the fuse is installed, $I_n > I_{SC\ MAX}$
In the absence of complementary information, use $I_{SC\ MAX} = 1,4 I_{SC}$
- Melting and reliably clearing the fault before the PV modules are damaged by the reverse current. $I_n < I_{RM}$
